Stars page

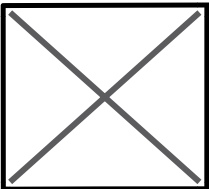

There are many different types of stars in the universe. Some are very hot and bright, while others are very cool and dim. The size of a star also varies greatly, from small red dwarfs to massive blue giants. The distance between stars is also vast, with many light years separating them.

Planets page

Planets are celestial bodies that orbit a star. They are much smaller than stars and do not produce their own light. Instead, they reflect the light of the star they orbit. Planets come in many different shapes and sizes, and some have rings and moons.
